===== WPI =====
TI - Information seeking device for telecommunication system - has a portable
    terminal with seeking function which in Internet puts together
    information covering geographical area in which portable telephone is
    located
AB - SE9602897 The information via the telecommunication system is presented
    for a user of the terminal. A portable computer is incorporated which is
    provided with a telecommunication modem and an Internet WWW reader. The
    computer can be coupled to the portable terminal when it receives the
    information from the Internet via the telecommunication network.
    - The portable computer uses a GSM modem and the portable terminal is a GSM
      telephone. The system incorporates a SP, a WWW server, an IDB and an IP.
      The WWW server communicates via GSM with the portable computer. The WWW
      server holds the whole time information from the GSM network concerning
      in which geographical area the GSM telephone is located. The IDB receives
      information concerning the geographical area from the IP.
    - ADVANTAGE - With the system, a user located in a specific geographical
      area can directly obtain information covering the services available
      within that area. (Dwg.1/1)
